

# PowerShell registration utility for VI Client Plug-ins.

---

The attached script allows you to register a plugin with VirtualCenter using the [VI Toolkit \(for Windows\)](#).

You can either paste it into your PowerShell session window or you can "source" it into your environment using the . operator (i.e. ". \registerExtension.ps1").

The script provides 3 functions,

1. Get-Plugin: List all installed plug-ins.
2. Remove-Plugin: Remove an installed plug-in.
3. New-Plugin: Define a new plug-in.

After registering a plug-in, log out of the VI Client (if you are logged into VirtualCenter) and log back in, and you should see your plug-in registered under the Plugins tab.
