

network config on Linux host ...

[pantau67](#) 4 posts since

Mar 9, 2007 Hi,

I'm running VmWare-Server on a Linux (SLES10) host.

I'd like to take a look into the network config of the server.

Under Windows it's very easily over the GUI.

Is there under linux a possibility to take a look into the network config without running the install script?

Running the install script means shutting down all VM's.

Please excuse my bad English.

Thanks

Pantau

ps -ax | grep "vmnet-bridge" shows you which interface is bridged to which vmnet

the settings for host-only and NAT are visible in the files below /etc/vmware/vmnet1 and /etc/vmware/vmnet8
