Does anyone know if VMWare are thinking of have release a VI Client for a Linux OS - I'm really trying to get away from using a Windows on my laptop and it would be great if I could use the VI Client on my OpenSUSE build...

 in response to: [oreeh](#) Hi all VMWare & Linux OS lovers.... I had a glimer of hope today for the VI Client running on an Linux OS Platform....

As I was reading this thread of all the people who would love to have VI Client running on Linux something occured to me, I use an app under Linux that allows you to install MS apps into Linux using Wine....

So far I run MS Office 2003, Lotus Notes, Internet Explorer 6 and a remote admin program called remote administrator

The application I use is called Cross Over Office by Codeweavers....

I tried installing the VI client and came up with some dependancys of the Windows Installer 2.0 which I installed OK, then it wanted .net framework so I installed that....

Came to installing the VI client but came up with some errors with regsvr32.exe - I'm going to try installing it again on

a test Linux box which I'm gonna run on VMWare Server 😊

I thought if I tell people of my path - they could help out and try some stuff themselves.... If I get any further I will let you know..

Regards

Dave

 in response to: [hillda01](#) As Virtual Center also has to be a windows server it's possible either to rdp to the VC Server and run from the remote session. Another option is to use [SeamlessRDP](#) so it will appear as if it is running locally.

VI Client For Linux???

Thanks for the link to seamlessrdp....

Ive got it working but I got one query....

When I log out of the VI Client it leaves my terminal services session running... how is it possible to end the TS session as well?

Regards

Dave

👤 in response to: [hillda01](#) You can set the RDP connection settings in Terminal Services Configuration on the server to end disconnected sessions after a certain time period. **Attachments:**
