

Fusion with XOS (10.5) Leopard & ...

Hi. I have not been successful in being able to get any openSUSE 10.2 || 10.3 installations.

I have trolled the stack debug info, and followed through the thread calls, and as all the openSUSE installs fail at the last point of the install (h/w setup) I can only assume at this point that either the problem is with the Video SAX2 rescan or some other XOS incompatibility. Tried both Fusion 1.0 & 1.1 Beta - same results - BUGGER!!!

Hopefully VM support will help us all out soon. **Attachments:**

i am having the same problem with sled10 sp1 x64 on leopard with fusion 1.1RC1, using my prod key. it failed at the very last h/w configuration with black blank screen, no cursor blinking.

when i restart the VM it prompts me that the installation failed and asked me to continue install or not. to continue only observe the same result; not to continue actually brings the VM to work correctly except my sound card isn't configured - i am ok with that. after this the VM appears to be working fine and i can configure my display in sled.

in all i was told that the installation failed but i am ok to use it for most part.
