

# BUG: settings for multi monitor usage ...

---

binkle 1 posts since

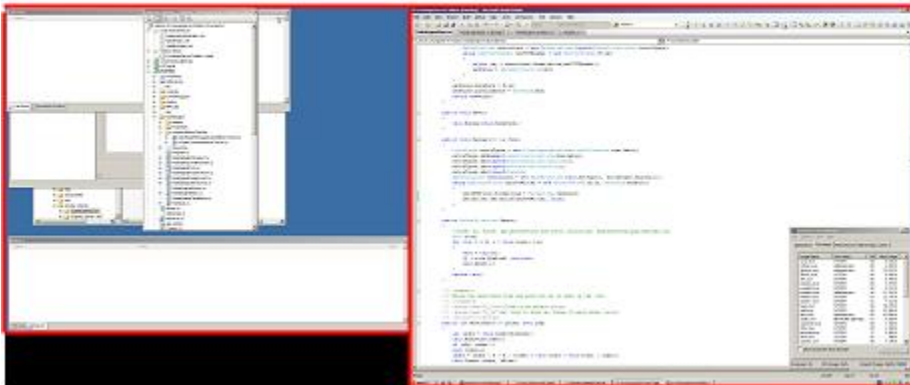

Dec 14, 2007 Hi,

im using V6.0.2 of WS. My guest system is a Win2003 Server (all current SPs). I use it in

- fullscreen mode
- set the VM to start in fullscreen mode
- autofit guest
- two monitors (one with resolution 1280x1024 a second one with 1600x1200)

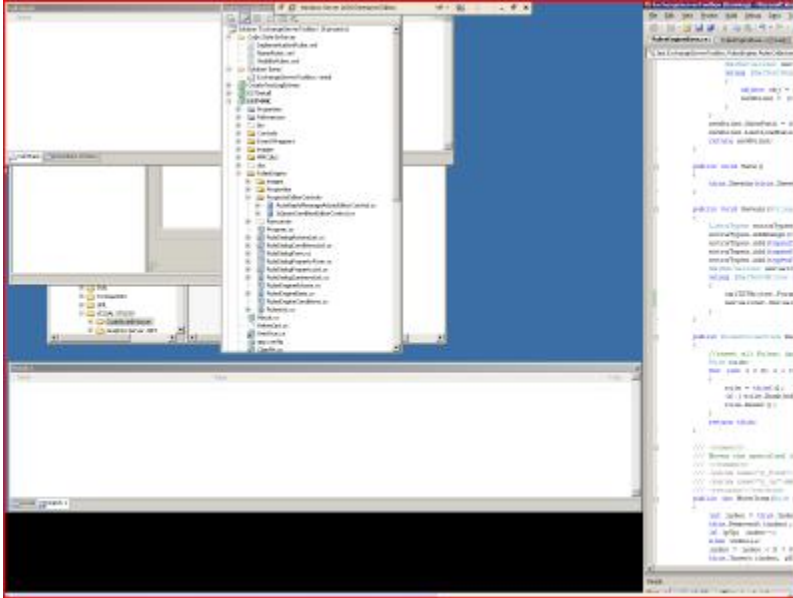

When I adjust the VM to that settings everything fine. suspending the VM seems to store the settings correct:

## Screenshot

But when I start the VM again (start in fullscreen) it does not use both monitors. It uses only the primary (right one) and the monitor settings/resolutions are lost:

BUG: settings for multi monitor usage ...

Greetings
