

# Vista connection properties empty ...

---

Hi.

I installed VMWare Workstation in a windows vista business 32bits. An error occurred during the installation maybe because the UAC was active I'm not sure.

In the network connection properties there are no protocols listed in the items list as in the attached picture. It happens in all my connection adapters wireless or wired. Now I can't change TCP/IP configurations for instance.

I tried to uninstall, reinstall, uninstall again, but the error still persists. The UAC is disabled. I'm afraid that I'll have to reinstall the Vista.

Please anyone solved this problem ? I really need help. **Attachments:**
