

smb_lookup every evening at 10PM ...

I have an ESX 3.02 host that every day at 10PM spews about 70 or 80 event logs of the same format smb_lookup: find //ISO failed, error=-5

This host is running the lab manager agent and I don't see it on my non labmanager servers.

We have verified that none of the VMs have the CD connected

I can't find anyone else having this issue so I thought I would post and see if anyone knows what's going on

Any help would be much appreciated.

Thanks

Can you post a excerpt of the event logs?
