No sound in XP (Boot CAMp partition) after installing the latest Fusion update. Any help would be appreciated.

↑ in response to: [jhersco](#) Please post any 1.1.1 issues you see in their own thread, so they don't get lost and can be answered individually.

Thanks,

Pat

I have a Macbook running Leopard (ver 10.5.2). I had been running VMware V1.1 on the Macbook with no issues. I also applied updates to my airport express with no issues. I updated my VMware from ver 1.1 to 1.1.1 last night and since then I have been unable to access my airport wireless network. I am able to ping my gateway. Do you know what the issue is and how it can be resolved. Any assistance will be much appreciated.

↑ in response to: [greenberry](#) Did you try to restart Fusion networking or rebooting? As recommended above, you may want to create your own top-level thread so the subject is more relevant.
