

increase fusion disk image ...

[petersaywhat](#) 1 posts since

Apr 23, 2008 We recently switched to Fusion from Parallels and used the VMWare importer tool to convert the existing Parallels disk image to a Fusion image. It worked great but we're getting errors in Windows about running out of disk space. I didn't setup the original Parallels image so I don't know if it was a set size or an expanding image but that's besides the point. Is there a way to either expand the existing Fusion image or transfer to contents of this image to a new, larger image?

Thanks,

Peter

To increase size of virtual disk, follow [Resizing a Virtual Disk for Windows Guests with Step by Step Instructions](#).

Other options include creating a second disk and storing your user data there, if they are the reason for the big size (the original disk would be just for Windows files and programs), or storing the data on shared folder (again if user data is what is the big thing).

To create a second bigger disk and move everything to it, you would have to use some specialized tool just like on a normal Windows PC with 2 drives - I think Norton Ghost could do that (sure others could do it as well, just this one came to my mind first).
