Is there a procedure I should undertake to ensure that

- a) it's looking for the correct VMDK file
- b) any manual way to resolve this

Thanks

That looks like a vm that is already in lab manager. Or at least was once in this or another lab manager installation, and LM really isn't equipped to expect a VC VM to even have a linked-clone chain, so I suspect it's failing to find the next vmdk in the chain.

What kind of history has this VM had?

Does that UUID on the sched.swap.device [48eda33e-b4edc3d0-db1f-001a64d47f64](#) match the uuid of your filesystem?
