

VMware Tools Installation fails to ...

Mercer 1 posts since

Jun 9, 2009

Imported XP SP3 vm from Parallels after removing Parallels Tools. All seemed to proceed correctly during VMware Tools installation except the mouse driver installation. which gives the following message: "Setup failed to install the mouse driver automatically. This driver will have to be installed manually." The Microsoft PS/2 mouse driver is installed, and the mouse works ok, but when I try to uninstall it and then install vmmouse.sys (which is version 12.4.0.2, the driver installer asks me to provide the "Compact Disk labeled 'VMware Pointing Device Driver Disk'" in drive D: or point to an alternate location.

Mouse is working ok with the PS/2 Compatible Mouse driver, but the inability of VMware Tools to install the vmmouse.sys driver is annoying. Any ideas on how to fix? VMX file attached. **Attachments:**

Basically this is a one time thing that the release notes say should be ignored...
