

Enumerate VMs with basic performance ...

[Netikus](#) 2 posts since

Jul 15, 2005 Hi,

Is there sample code available that shows how to enumerate virtual machines, and get their basic performance properties (e.g. memory usage, CPU usage, network usage)?

Is this even possible? After glancing through the API, I didn't find a way to get the current CPU usage for example. I'd like to do all this in C.

Thank you for any hints

Look into the VI SDK and vmwarescripting.com.
