

Windows 2003 CPU MIBS - not gauge:32 ...

[jcarter](#) 1 posts since

Oct 2, 2006 I'm trying to find an appropriate MIB to monitor CPU utilization on a Windows Server 2003 guest. We have physical servers (HP DL380-G4) where we monitor OID 1.3.6.1.4.1.232.11.2.3.1.1.2.0 from the guest OS. But after virtualizing it appears I need to look at a different MIB. The reason is that we load balance transactions to a farm of servers based on how not busy they are. This is done using a Radware App Director load balancing device that redirects web requests. unfortunately the only MIBs I have found so far are Gauge:32 mibs and the radware cannot use those counters. Any suggestions are appreciated.
