Hi,

We currently use NLB within our VM's for alot of our reporting services and web for increased availability at our Primary site. We will be implementing SRM in the very near future and would like to know what potential issues there will be failing over these servers via srm to our DR site. Specifically with changing IP addresses.

Does anyone have this implemented as yet

Currently have ESX 3.5 and Virtual Centre 2.5.0.64237

Any advice would be great

Thanks
