

# Problem with VMWARE RHEL - WINXP ...

---

emigcrd 1 posts since

Jul 3, 2009 Hi community,

I am currently working with RHEL 4 I intalled vmware 5 using WinXP professional as guest OS , I have a problem with vmware, but I can not see clearly how can I solve (I am a new vmware user ), I see in log files the following output:

vmware.log

Unable to continue without a UI.

- attempt to put segment in horiz list twice

Unable to continue without a UI.

- attempt to put segment in horiz list twice

The application 'vmware' lost its connection to the display localhost:1.0;  
most likely the X server was shut down or you killed/destroyed  
the application.

1. more ui-4712.log

Problem with VMWARE RHEL - WINXP ...

Jul 03 09:55:29: vmui| VMNetCtlConstruct: no Network Names to list

Jul 03 09:55:29: vmui| VMUIGtkVmdb\_LoadDevice: unhandled device class scsiCtrl

Jul 03 09:32:20: vmui| Caught signal 15 -- pid 4712 (eip 0x0010d7a2)

I think the problem is related to "Jul 03 09:55:28: vmui| VMHSCbUtilFileLs failed: File not found

(/root/vmware/Windows XP Professional/Windows XP Professional.vmx)" this file exist in the platform, is possible that exist any missconfiguration?, you have had any similar experience with this problem?

Thanks a lot for your help!

You may want to update your Workstation to the latest 5.x version (currently 5.5.9, I believe) and see if it resolves any of your issues.

Also, check the user rights/permissions on the VM's folder and files. Workstation requires read/write/execute for the vmx file, read/write for the other files and the folder.
