

Cable Modem / DSL Modem / Router / WiFi Access Point

VMware's Network has been modified to use en0 (Wired Ethernet Adapter). This is done by modifying the boot.sh script and directions are included in the .pdf file.

The Windows Network Subnet can either be manually configured or using a Router as a DHCP Server. The starting Address reflects a Router in place.

Add an additional Network to the Virtual Machine and set it to Host Only. Set the default Network from NAT to Bridged.

IP Address used herein are examples to illustrate the different subnets. Modify accordingly.

192.168.1.2 (en1 - WiFi)
 &
 192.168.3.1 (vmnet1 - Host Only)
 &
 192.168.3.128 (Host Only)
 &
 192.168.2.6 (Bridged to en0 via vmnet0)
