

Adding new domain to shared solution

Add domain administrator (or user with add computer rights) to VC.
Done when configuring View Manager to vCenter server.

This action will fail if vCenter server cannot access domain controller of new domain.

Add Domain Administrators

Administrator Information

Full domain name:
(E.g., domain.com)

User name:
(E.g., domain.com\username)

Password:

View Manager – VC Configuration

When adding a new View manager existing admin accounts for other domains will be visible, Composer will display all registered administrators independent of Domain properties of VVM

VirtualCenter Settings

Server address: *

User name: *

Password:

Description:

Connect using SSL

Creating desktop pools

When creating desktop pool all administrators will be visible. New desktops will not work if wrong administrator account is chosen.

Add Desktop

QuickPrep Settings
QuickPrep is used to configure desktops after they have been created

In order to join desktops to a domain, QuickPrep requires domain administrator credentials for the target domain. Select the desired domain\administrator entry from the Domain Administrator Account drop down menu. QuickPrep can also execute scripts on power-off and after creating new desktops or after a recomposition or refresh event. Enter paths (located on the Parent VM) to the scripts.

Domain administrator account:

Power-off script:

Post synchronization script:

The AD container relative distinguished name (e.g., CN=Computers or OU=Marketing):
