

Known Issues

Please note the list of known issues during the course of the Beta program.

1. Deletion of Node pools is not reliable, it will fail in the server.
2. Deletion of Cluster is not reliable, it will fail in the server.
3. CSE 3.1.3 TKGm pre-existing clusters will show up as 'VMware Tanzu Kubernetes Grid Legacy', however, will not be read-only clusters. This is work in progress and operations on these clusters will not be allowed in GA.
4. Default Storage Class details will not be visible in Cluster Info page in the UI.
5. Cluster Upgrade may lead to a VM being in provisioned state for several minutes or so. The workaround is to delete that VM from the VCD-UI and Upgrade will recreate the VM and finish off.
6. Any additional templates, other than the two allowed TKG K8's OVA's, in the shared catalog in VCD lead to an empty list in the Container UI Plugin where one makes a selection of the K8s template. The workaround is to remove additional templates and only have allowed two templates in the shared catalog.
7. If you leave the CSE service running for a few days, you could see "NOT_AUTHENTICATED" error with a message "This operation is denied". The workaround is to restart the CSE service.
